

Pliant Augments Terraform

The next step to building end-to-end automation.

Run all of your automation from a single secure location.

Pliant provides one secure location to run all of your automation from — easing the burden of governance and logging. Pliant's portal allows you to organize, visualize and natively run all of your playbooks — even those that already exist prior to utilizing Pliant.

Terraform is an open-source infrastructure as a code software tool that provides a consistent CLI workflow to manage hundreds of cloud services. Terraform codifies cloud APIs into declarative configuration files which are easily connected to third-party applications with Pliant's integration — enabling you to achieve end-to-end automation.

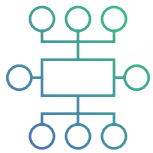

Terraform Challenges

Pliant Solutions

Templates

Pliant enables IT teams to execute existing templates for automation with Terraform.

Third Party Systems

Pliant calls Terraform from a third-party system, via RESTful endpoint. Pliant lets you seamlessly and securely weave Terraform scripts into larger processes that involve 85+ vendors and APIs.

Already Existing Automation

Pliant allows IT professionals to extend already existing Terraform based automation.

Security

Pliant provides role-based access control to your Terraform scripts permitting only certain users to run scripts.

Start your digital transformation journey by integrating Terraform with Pliant and begin building internal end-to-end automation today — [request a free trial](#) or [contact us here](#).
